## DYNAMIC EQUILIBRIUM

### Population Calculation Practice

1. Calculate the population density if there were 300 birds in a 10 ha area in 1985 near Sylvan Lake.

$$D = N/A \quad = 300/10 \quad = 30 \text{ bird/hectare}$$

2. Data from a sparrow population was collected over a year in Jan., 1999.

Original Population: 1000  
Natality: 800  
Mortality: 600  
Immigration: 300  
Emigration: 200

Calculate the population growth rate.

$$\begin{aligned} Gr = ? \quad Gr = \Delta N / \Delta T \quad \Delta N = (n+i)-(m+e) \quad \text{so...} \quad &= 300 / 1 \text{ year} \\ &= 300 \text{ sparrows} \\ &Gr = 300/\text{yr} \end{aligned}$$

3. In Canada, the population in 1986 was 25.0 million compared to 23.1 million in 1976. Calculate the annual per capita growth rate.

$$\begin{aligned} Cgr = ? \quad Cgr = \Delta N / N^i \quad &= \frac{25 \text{ million} - 23.1 \text{ million}}{23.1 \text{ million}} \\ &= 0.0822 \end{aligned}$$

4. On a range of 450 hectares, there are 1 275 jackrabbits. Studies indicate the following counts for this population:

a. Determine the change in population size.	Mortality	2 225/year
b. Determine the per capita growth rate.	Natality	3400/year
	Emigration	775/year
	Immigration	150/year

$$\begin{aligned} a. \quad \Delta N = (n+i)-(m+e) \\ &= (3400+150)-(2225+775) \\ &= 550 \end{aligned} \quad \begin{aligned} b. \quad cgr = \Delta N / N^i \\ &= 550 / 1275 \\ &= 0.43 \end{aligned}$$

5. On October 15, 1992, the beginning of the grouse hunting season that year, biologists counted 75 spruce grouse in a 30 hectare forest plot. On December 15, 1992, 42 spruce grouse were counted in the same area.

a. What was the density of the grouse population on October 15? On December 15?

$$\begin{aligned} D = N/A \quad &D = N/A \\ = 75/30 \quad &= 42/30 \\ = 2.5 \text{ grouse/ha} \quad &= 1.4 \text{ grouse/ha} \end{aligned}$$

6. Data from a sparrow population was collected over a year, starting in January 1995. The study area was 4 000 ha.  
Original population 200 000 (January 1995)  
Natality 150 000  
Mortality 130 000  
Immigration 5 000  
Emigration 2 000

1. a.) Calculate the original population density. Record your answer as a whole number.

$$\begin{aligned} D &= N/A \\ &= 200000/4000 \\ &= \mathbf{50 \text{ sparrow/ha}} \end{aligned}$$

1. b.) Calculate the new population size. Record your answer as a whole number.

$$\begin{aligned} \Delta N &= (n+i)-(m+e) \\ &= (150000+5000)-(13000+2000) \\ &= 23,000 \\ &= 23,000 + 200,000 = \mathbf{223,000 \text{ sparrows}} \end{aligned}$$

1. c.) Calculate the new population density. Record your answer as a whole number.

$$\begin{aligned} D &= N/A \\ &= 340000 / 4000 \\ &= \mathbf{85 \text{ sparrows/ha}} \end{aligned}$$

1. d.) Calculate the per capita growth rate (cgr) for the 1995 year.

$$\begin{aligned} cgr &= \Delta N / N^i \\ &= \frac{140,000}{200,000} \quad \begin{array}{l} \text{(already calculated)} \\ \text{(initial population)} \end{array} \end{aligned}$$

$$\mathbf{Cgr = . 0.7}$$

- 1) Limiting factors can be classified as density dependent and density independent. The severity is dependent on population size in regards to density dependent factors. Density independent factors affect any population size equally. For each of the following indicate if they are DD or DI.

\_\_DI\_\_ 1. Freezing weather

\_\_DD\_\_ 2. Has a greater effect on a larger population

\_\_DI\_\_ 3. A volcanic eruption

\_\_DD\_\_ 4. Predation

\_\_DI\_\_ 5. Floods

\_\_DD\_\_ 6. Food supply

\_\_DI\_\_ 7. May limit the population before it even gets close to carrying capacity

\_\_DD\_\_ 8. Disease or parasites

\_\_DD\_\_ 9. Decreases when the population is below carrying capacity; increases when the population exceeds carrying capacity

\_\_DI\_\_ 10. Fire

\_\_DI\_\_ 11. Intensity of effect no greater for larger population, no less for smaller population

\_\_DD\_\_ 12. May cause cyclical changes in lynx and hare populations

\_\_DI\_\_ 13. Storms

\_\_DD\_\_ 14. Tends to be a biotic factor

\_\_DI\_\_ 15. Tends to be an abiotic factor

- 2) K-selected and r-selected life histories are the two ends of the spectrum of life-history patterns. State whether each of the following characteristic is an example of a K-selected life history pattern (K) or an r-selected life history pattern (r).

- ☐ r ☐ K 1. Age at first reproduction occurs younger
- ☐ r ☐ K 2. Relative body size is small
- ☐ K ☐ r 3. Stability of population near carrying capacity
- ☐ K ☐ r 4. Low number of offspring
- ☐ r ☐ K 5. Large number of offspring per reproduction
- ☐ K ☐ r 6. Emphasis on quality and care of offspring
- ☐ K ☐ r 7. Polar bears are an example
- ☐ r ☐ K 8. Rapid population growth when conditions are favourable
- ☐ r ☐ K 9. Dandelions and insects are examples
